True

There are two types of relationships in object oriented programming. Is-a relation and has-a relation. Classes and objects are organized in a large software by using these relations.

True 98.9%

1.1% False
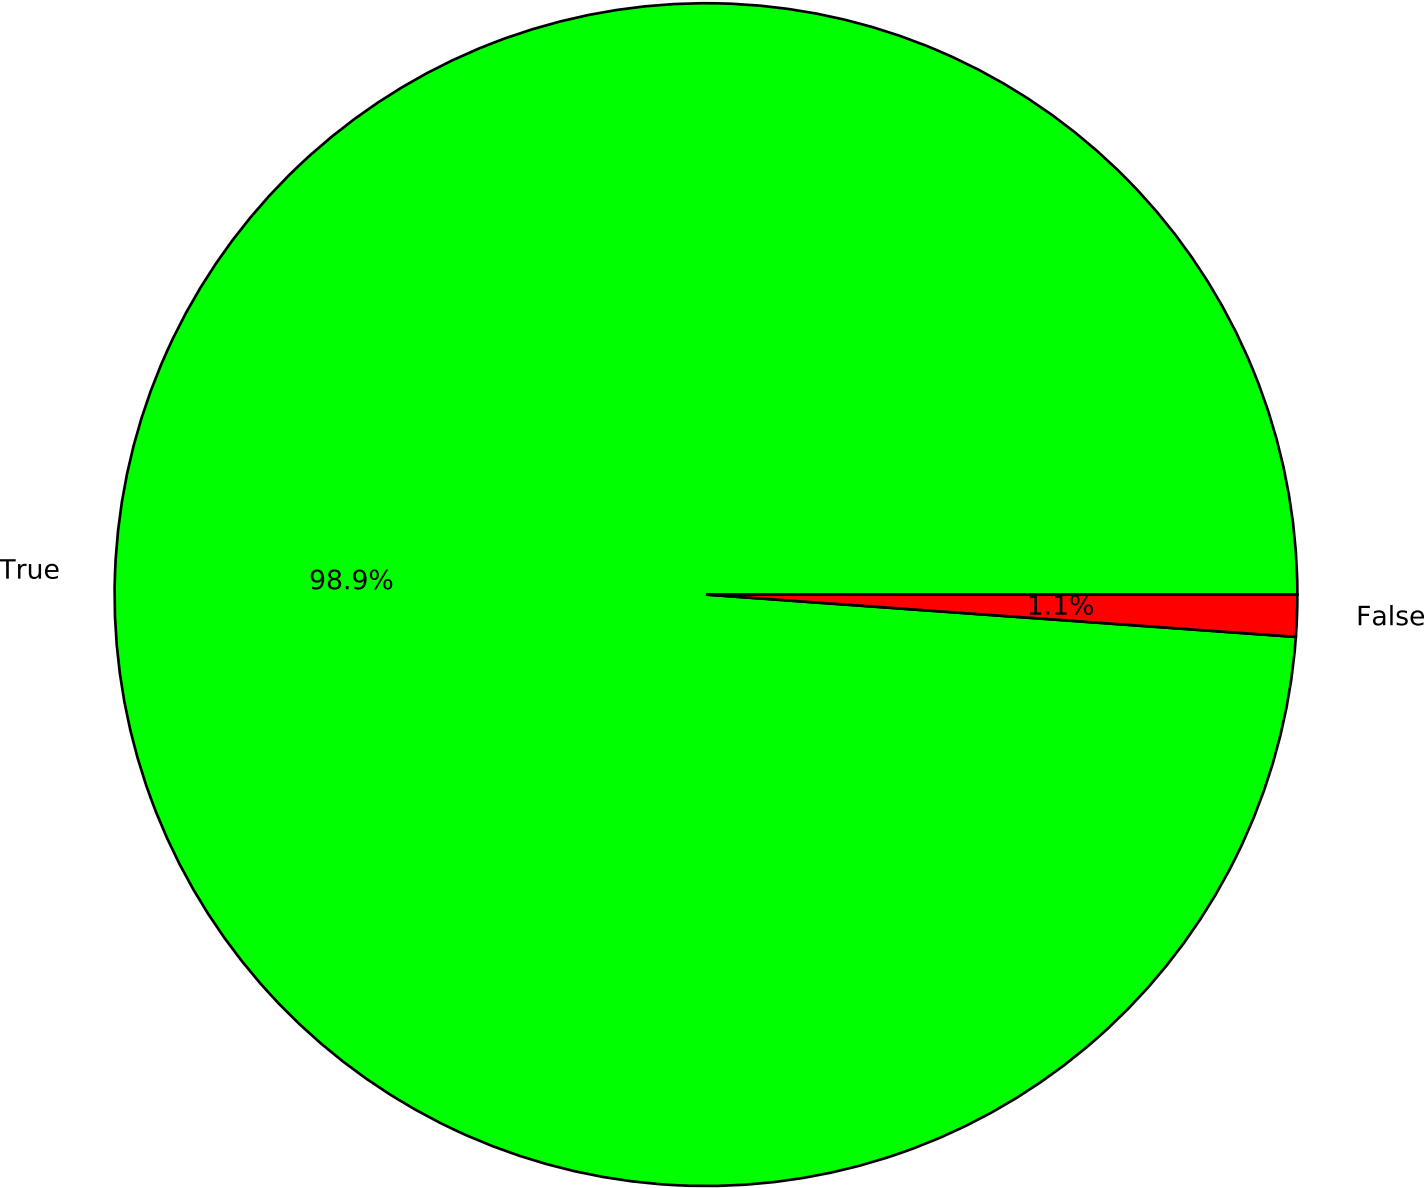

Account <- SavingsAccount example shows is-a relation. This means that SavingAccount inherits from Account class. In other words Account class is a generalization of SavingsAccount class.
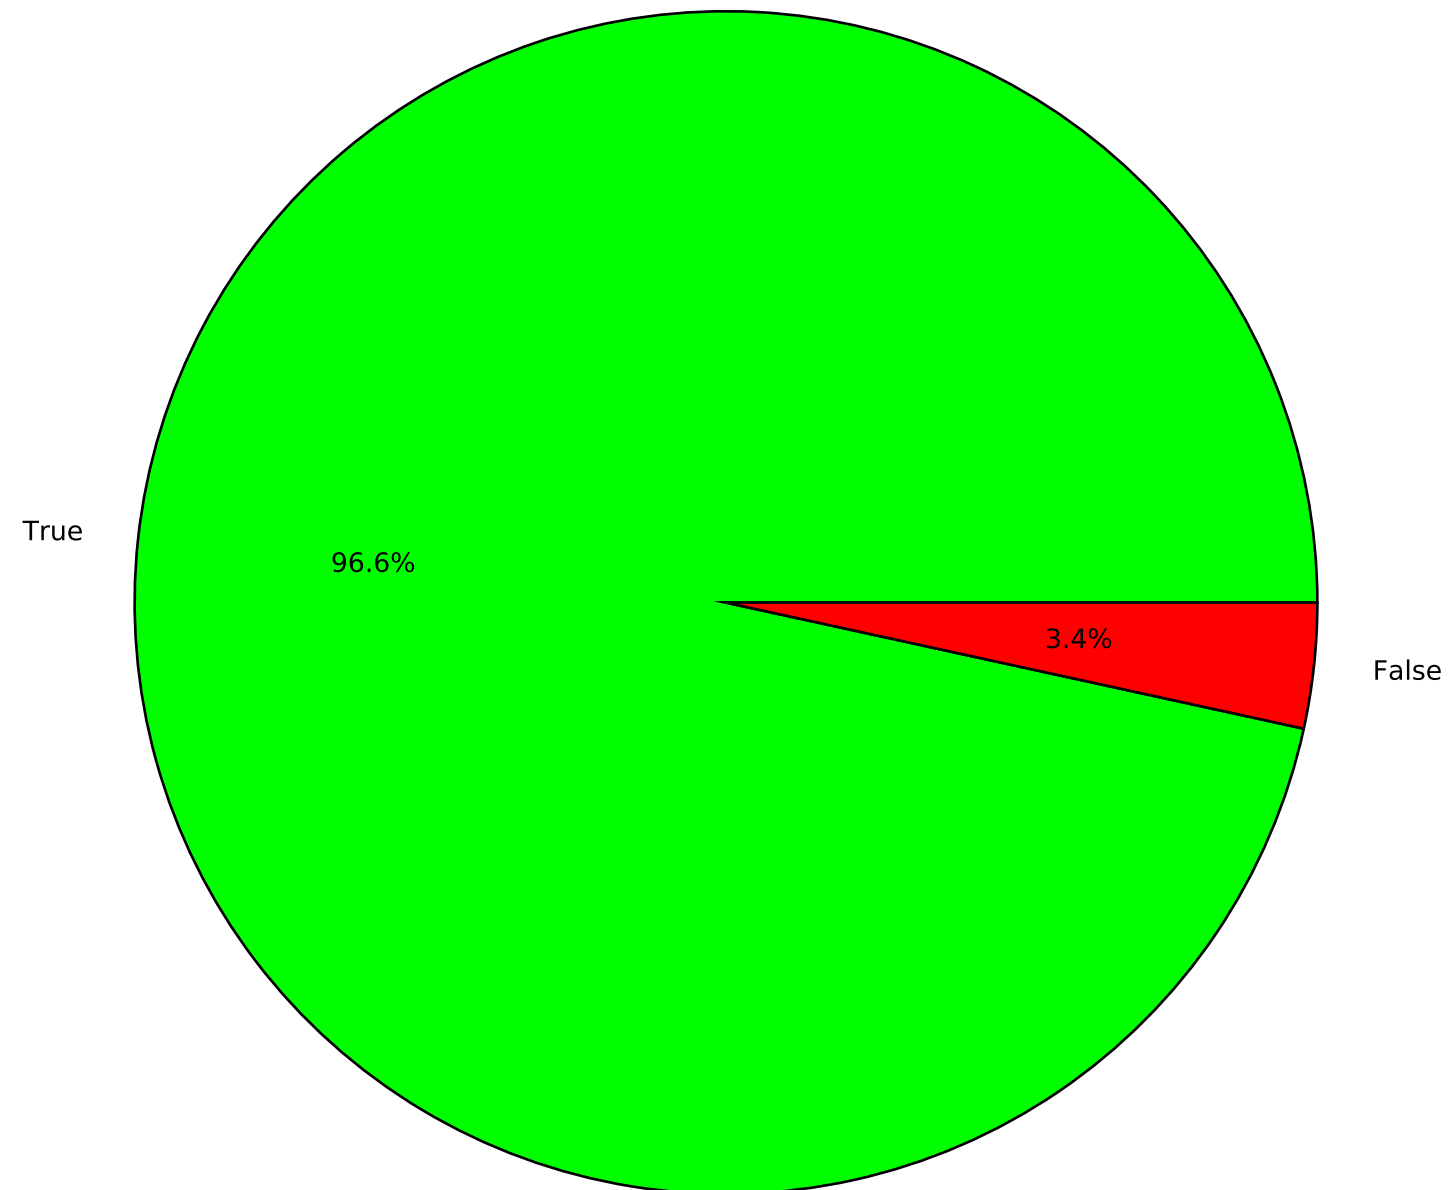

Is-a relation is implemented by composition in OO programming.

False 70.9%

True 29.1%
